# SAMPLING DISTRIBUTION OF MEAN ( O UNKNOWN)

## t-Distribution

t-distribution is used when sample size is <30 and the population standard deviation is unknown.

t-statistic is defined as

$$t = \left(\frac{\overline{x} - \mu}{s}\right) \sqrt{n}$$

where Sample standard deviation  $S = \sqrt{\frac{\sum (x - \overline{x})^2}{n-1}}$ 

n is Sample Size

X is sample mean

µ is population mean

Suppose we obtain a frequency distribution of the by computing the value of the for each of the Samples of size n drawn from a normal or a nearly normal population. The sampling distribution so obtained is called the "Student's" the distribution.

#### Problems

1. A random sample of size 16 has 53 as mean.

The Sum of squares of the deviation from mean is 135. Compute t-statistic by taking the population mean as 56.

$$n = 16$$
,  $\overline{X} = 53$ ,  $\sum (X - \overline{X})^2 = 135$ ,  $\mu = 56$ 

$$S = \sqrt{\frac{\sum (X - \overline{X})^2}{n - 1}} = \sqrt{\frac{135}{15}} = 3$$

$$t - \text{statistics} \quad t = (\frac{\overline{X} - \mu}{S})\sqrt{\pi} = (\frac{53 - 56}{3})\sqrt{16}$$

$$= -4$$

$$\overline{X} = 42$$

$$n = 20$$

$$S = 5$$

$$t = \left(\frac{\overline{x} - \mu}{S}\right)\sqrt{n} = \left(\frac{42 - 45}{5}\right)\sqrt{20}$$

$$= -2.6832$$

$$\sum (x-\overline{x})^{2} = (45 - 49.111)^{2} + 2(47 - 49.111)^{2} + (50 - 49.111)^{2}$$

$$+ (52 - 49.111)^{2} + (48 - 49.111)^{2} + (49 - 49.111)^{2} + (53 - 49.111)^{2}$$

$$+ (51 - 49.111)^{2}$$

$$= 16.90 + 8.9126 + 0.790321 + 8.3463 + 1.2343 + 0.6123$$

+15.124 + 3.568

$$S = \sqrt{\frac{\sum (x - \overline{x})^{2}}{n - 1}} = \sqrt{\frac{54.8878}{8}} = \sqrt{6.8609} = 2.62$$

$$t = (\overline{\overline{x} - \mu})\sqrt{n} = (\frac{49.111 - 47.5}{2.62})\sqrt{9}$$

$$= 1.84465$$

4. Ten individuals are chosen at random from a mormal population of students and their marks found to be 63, 63, 66, 67, 68, 69, 70, 70, 71, 70. Find the statistics t score if the mean marks of the population of students is 66.

$$\begin{array}{ll} n=10 & \overline{X} = \frac{1}{10} \left[ 63 + 63 + 66 + 67 + 68 + 69 + 70 + 9 + 66 \right] \\ \mu = 66 & 70 + 71 + 70 \right] = \frac{677}{10} = 67.7 \\ \sum (x - \overline{X})^2 = 2(63 - 67.7)^2 + (63 - 67.7)^2 + (67 - 67.7)^2 + (71 - 67.7)^2 + (68 - 67.7)^2 + (69 - 67.7)^2 + 3(70 - 67.7)^2 + (71 - 67.7)^2 \\ = 44 \cdot 18 + 2 \cdot 89 + 0 \cdot 49 + 0 \cdot 09 + 1 \cdot 69 + 15 \cdot 87 + 10.89 \\ = 75 \cdot 61 \\ 8 = \sqrt{\frac{\sum (x - \overline{X})^2}{n - 1}} = \sqrt{\frac{75.61}{9}} = 2.9 \end{array}$$

$$E = \left(\frac{X - \mu}{S}\right)\sqrt{n} = \left(\frac{67.7 - 66}{2.9}\right)\sqrt{10} = 1.8537$$

- 5. A filling machine is expected to fill 5 kg of powder into bags. A sample of 10 bags gave the following weights 4.7, 4.9, 5, 5.1, 5.4, 5.2, 4.6, 5.1, 4.674.7. Find the t-score.
- 6. The following values gives the lengths of 12 samples of egyptian cotton taken from a consignment; 48, 46, 49, 46, 52, 45, 43, 47, 47, 46, 45, 50. Find The t-Score if the mean length of the consignment is 46.

## SAMPLING DISTRIBUTION OF VARIANCE

# CHI-SQUARE DISTRIBUTION

When a coin is lossed 200 times, the theosetical Considerations lead us to expect 100 heads and 100 tails. But in practice, these results are 100 tails. But in practice, the quantity  $\chi^2$  describes the 100 magnitude of discrepancy between the observed and expected observations. If  $\chi = 0$ , the observed and expected 100 trequencies completely coincide. The greater like 100 trequencies, the greater is the value of  $\chi^2$ . It is greater is the value of  $\chi^2$ . Thus  $\chi^2$  affords a measure of the correspondence 100 between theory and observation.

If f1, f2, f3 --- fn is a set of observed

where 
$$\sum_{k=1}^{n} P_k = \sum_{k=1}^{n} P_k = N$$
 [Total Frequency] and degrees of Freedom (d.f.) =  $n-1$ 

Note: - (i) If 
$$\chi^2=0$$
, the observed and theoretical frequencies agree exactly (ii) If  $\chi^2>0$  they do not agree exactly.

#### PROBLEMS

1. The following table gives the number of road accidents that occurred in a large city during the various days of a week. Calculate  $\chi^2$  for the above data.

Day	Sun	Mon	Tue	Wed	Thus	Fai	sat	total
No of accidents	14	16	08	12	1.1	9	14	84

$$e_i = \frac{84}{7} = 12$$

$$\chi^{2} = \frac{(14-12)^{2}}{12} + \frac{(16-12)^{2}}{12} + \frac{(8-12)^{2}}{12} + \frac{(12-12)^{2}}{12} + \frac{(11-12)^{2}}{12} + \frac{(14-12)^{2}}{12} + \frac{(14-12)^{2}}{12} = 4.17$$

2. In 200 tosses of a coin, 118 heads and 82 tails were observed. Find the 1/2.

observed frequency of heads & tails  $f_1 = 118$ ,  $f_2 = 82$ 

$$N = \sum f_i = 118 + 82 = 200$$

Expected Frequency of heads & tails on 200 trials are  $e_1 = 200 \times \frac{1}{2} = 100$ ,  $e_2 = 200 \times \frac{1}{2} = 100$ .

$$\chi^{2} = \frac{(f_{1} - e_{1})^{2}}{e_{1}} + \frac{(f_{2} - e_{2})^{2}}{e_{2}}$$

$$= \frac{(118 - 100)^2}{100} + \frac{(82 - 100)^2}{100} = 6.48$$

(3) A survey of 240 families with 3 children each revealed the distribution shown in the following table. Is the Find  $\chi^2$ .

Soin: Let p = pbty of q male births q = pbty of q remale births

Among 3 children, the Pbty that 
$$x$$
 childrens are boys is given by  $3_{c_x} \left(\frac{1}{2}\right)^x \left(\frac{1}{2}\right)^{3-x}$ 

$$P(3B) = {}^{3}c_{3}\left(\frac{1}{2}\right)^{3}\left(\frac{1}{2}\right)^{3-3} = \frac{1}{8}$$

$$P(2B) = {}^{3}c_{2}\left(\frac{1}{2}\right)^{2}\left(\frac{1}{2}\right)^{1} = \frac{3}{8}$$

$$P(1B) = {}^{3}c_{1}\left(\frac{1}{2}\right)^{1}\left(\frac{1}{2}\right)^{3-1} = \frac{3}{8}$$

$$P(0B) = {}^{3}c_{3}\left(\frac{1}{2}\right)^{1}\left(\frac{1}{2}\right)^{3-1} = \frac{3}{8}$$

Among 240 Families, the expected no of families with 3B is  $e_1 = 240 \times \frac{1}{8} = 30$ 

2B is 
$$e_2 = 240 \times 3|_8 = 90$$

1B is  $e_3 = 240 \times 3|_8 = 90$ 

0B is  $e_4 = 240 \times 1|_8 = 30$ 

From the table  $f_1 = 37$ ,  $f_2 = 101$ ,  $f_3 = 84$ ,  $f_4 = 18$   $\chi^2 = \frac{(37-30)^2}{30} + \frac{(101-90)^2}{90} + \frac{(84-90)^2}{90} + \frac{(18-90)^2}{30}$  = 8.1773
